**Abstract** This study evaluated chemical composition and *in vitro* antioxidant activity of *Ocimum americanum*. Standard methods were used in determination of phytochemicals and high performance liquid chromatography (HPLC) with UV visible detector was used in analyses of carotenoids and vitamins. Chemical compounds in ethyl acetate extracts were determined using GC-MS with National Institute of Standards and Technology (NIST), 2011 chemical compounds database. Antioxidant activity was determined by 1, 1-diphenyl-2-picrylhydrazyl (DPPH), phosphomolybdate and reducing power assays. *O. americanum* contains diverse chemical compounds and the antioxidant activity was high. The ethyl acetate extracts contained 69 chemical compounds ranging from phytosterols, terpenes and fatty acid derivatives, among many others. These chemical compounds and antioxidant activity could be responsible for the efficacy in management of many diseases among the Kenyan societies.

**Keywords** Antioxidant activity, Phytochemicals, *Ocimum americanum*, DPPH assay, Phosphomolybdate assay

## 1. Introduction

The use of medicinal plants is embedded in the human cultural fabric ever since the times of early man. Medicinal plants are a source of a wide and diverse variety of phytochemicals that are of great medical importance. Knowledge of the chemical constituents of plants is desirable, not only for the discovery of therapeutic agents, but also because such information is invaluable in availing new chemical resources [1]. The World Health Organization (WHO) emphasizes on the use of traditional medicines and has reported that about 80% of population from developing countries relies on medicinal plants for their primary health care [2, 3]. Popular and scientific observations on the safety and efficacy of medicinal plants significantly contribute to discovery of their therapeutic potential and search of active chemical constituents.

According to WHO, despite existence and continued use of medicinal plants over many centuries, they have not been officially recognized in most countries. The main reason for this would be lack of reliable research data and acceptable methodology on the medicinal plants for proper evaluation

of their counterparts and claims by medicinal plants practitioners and herbalists [1]. Consequently, there is an urgent need for research, training and education on medicinal herbs especially on the composition, safety and efficacy to tap the multiple potentials they possess, and provide a criteria for their evaluations and standardization.

*Ocimum americanum* L. (syn. *O. canum* Sims) belongs to the family Lamiaceae, a plant species widely distributed in the tropics and sub-tropics of the Old and New World. Contrary to its name it is not native to America, but only to Africa and Asia [4]. It is referred to as “Makuruthi” by Ameru and “Mutaa” by Mbeere people of eastern part of Kenya. The essential oils found in this species have strong fungicidal activity against certain plant pathogens [5]. In Africa, leaves of *O. americanum* are used as an insecticide for the protection against post-harvest insect damage especially the ones caused by bruchid beetles [6]. The active ingredients are also likely to be associated with the essential oils. However, some medicinal properties may be associated with the external flavonoids, as some specimens produce very high levels of these compounds, especially nevadensin, which has antioxidant activity [7].

This study evaluated the qualitative and quantitative chemical composition, and *in vitro* antioxidant activities of *O. americanum*. The current study supports the use of *O. americanum* in management and treatment of various diseases based on its chemical compositions and helps in

accurate formulations of products that are efficacious and stable for consumption.

## 2. Materials and Methods

### 2.1. Collection of Plant Materials

Leaves and stems of *Ocimum americanum* were collected from their geo-ecological habitats in Mbeu village, Tigania, Meru County of Kenya based on their folkloric use as was obtained from traditional medical practitioners. The plants were authenticated by a Taxonomist at the Department of Plant and Microbial Sciences, Kenyatta University, Kenya and a voucher specimen deposited at the Kenyatta University Herbarium for future reference.

### 2.2. Preparation and Extraction of Plant Materials

The plant materials were processed according to methods in our laboratory and as described elsewhere [8]. Briefly, 100 g of plant materials was extracted in 1 L of distilled water. Similarly, 100 g was extracted in 1 L of ethyl acetate and the extracts freeze dried, weighed, and stored in clean air-tight polythene bags for further analyses.

### 2.3. Qualitative and Quantitative Determination of Chemical Compounds

Preliminary phytochemicals screening and quantitative determination was carried out according to the methods described elsewhere [8]. The following phytochemicals were screened and quantified; flavonoids, polyphenols, alkaloids and tannins among others. Screening of chemical compounds in ethyl acetate extract was carried out using gas chromatography mass spectrometry (GC-MS) according to methods published in our laboratory [9]. The chemical compounds were identified based on their mass spectra by deconvolution of the chromatographs and matching with the compounds in the NIST 2011 database [9].

The following vitamins and carotenoids were quantified using reverse phase high performance liquid chromatography (HPLC) fitted with UV/Vis detector; vitamin B1, B3, retinol, tocopherol, ascorbic acid,  $\beta$ -carotene, lycopene, and  $\beta$ -cryptoxanthin; according to method described elsewhere in our laboratory [8].

### 2.4. Antioxidant Activity

Antioxidant activity was determined according to the following three methods; 1, 1-diphenyl-2-picrylhydrazyl

(DPPH), Phosphomolybdate and reducing power assay, as described elsewhere [8].

## 3. Results

### 3.1. Qualitative and Quantitative Phytochemicals

The ethyl acetate and aqueous extracts yielded a dark brown and a light brown paste of concentrations of 215.7 and 168.0 mg/g dry weight, respectively. The following phytochemicals were found in the plant materials; tannins, phenols, and saponins among others as shown in Table 1. For the quantitative composition, it was found that saponins were the highest with  $114.7 \pm 11.5$  mg per gram dry powder, while the lowest was tannins at  $4.70 \pm 0.04$  mg per g of dry materials. The total phenols yield was  $1.54 \pm 0.06$  mg gallic acid equivalent per gram of dry powdered material, as shown in Table 2.

**Table 1.** Qualitative screening of the phytochemicals in *O. americanum*

Phytochemicals	Results
Tannins	++
Phenols	++
Saponins	++
Phylobatannins	++
Terpenoids	++
Flavonoids	+++
Steroids	++
Cardiac glycosides	+
Glycosides/ reducing sugar	+
Alkaloids	+

**Legend:**

The sign: + Phytochemicals detected in low levels  
 ++ Phytochemicals detected in moderate levels  
 +++ Phytochemicals detectable in high amount

### 3.2. Nutritional Composition

The amounts of nutrients were determined using reverse phase HPLC-UV vis detector. The nutrients determined were both conjugated and non-conjugated carotenoids and vitamins A, E, B1, B3 and C. It was found that retinol was the highest in concentrations at  $84.09 \pm 0.009$  mg/100 g, followed by vitamin B1 at  $69.50 \pm 7.1$  mg/ 100 g of dry powder. Vitamin B3 was not detected. Other nutrients quantified include lycopene,  $\beta$ -carotene,  $\beta$ -cryptoxanthin, tocopherol as shown in table 3.

**Table 2.** Quantitative chemical composition of *O. americanum*

Plant	Class of phytochemicals and amounts				
	Total phenols	Alkaloids	Saponins	Flavonoids	Tannins
<i>O. americanum</i>	1.54±0.06	60.7±12.9	114.7±11.5	9.26±0.03	4.70±0.04

Quantities are expressed as mean  $\pm$  standard deviation (SD) of three determinations for each powder. The total phenols were expressed as mg gallic acid equivalents per g dry powder, and tannins as mg/kg of gallic acid standard, while other measured phytochemicals were expressed as mg per g of dry powder. The flavonoids were expressed as mg pyrocatechol equivalent.

**Table 3.** Nutritional composition of *O. americanum* powder

Nutrient	Amounts in mg/100g dry matter
Ascorbic acid	42.89±0.30
Vitamin B1	69.5±7.1
Vitamin B3	Not detected
Retinol	84.09 ± 0.009
Tocopherol	0.56± 0.030
Lycopene	0.36±0.009
β-carotene	65.52± 0.014
B-cryptoxanthin	0.14± 0.002

The results are expressed as mean ± standard deviation of three determinations and in mg/100 g of dry plant powder.

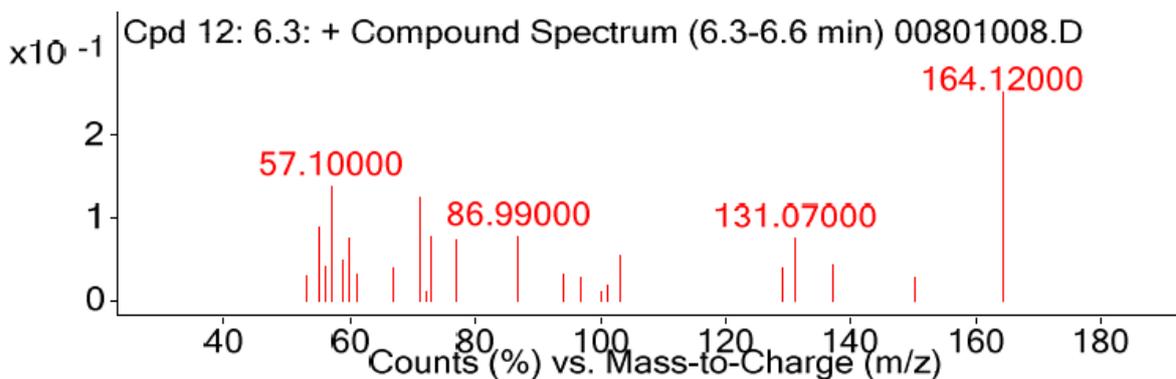

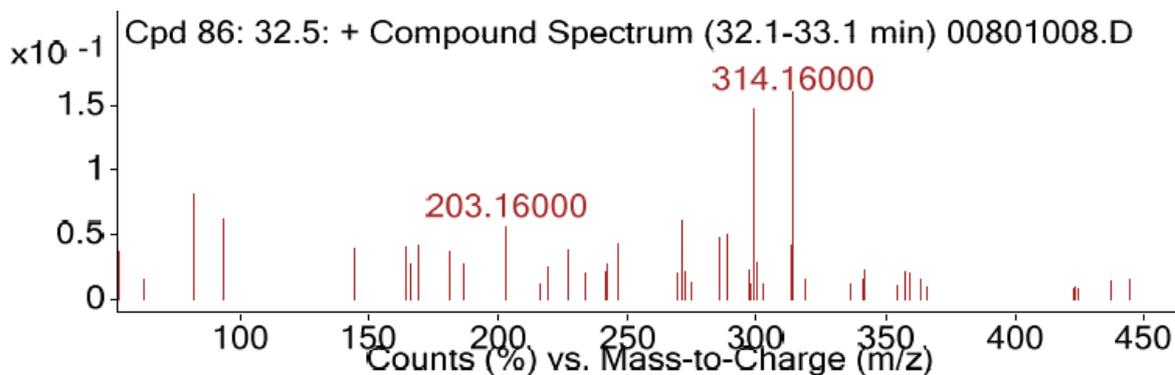

### 3.3. Compounds from Ethyl Acetate Extracts

As depicted in Table 4 and Figure 3.4, 69 diverse chemical compounds were detected from ethyl acetate of *O. americanum*. These compounds range from phytosterols, fatty acids and fatty acids derivatives, terpenoids, alkaloids and phenolics among others, whose fragments were repeated severally in the chromatographs. We could not establish the identity of nine (9) compounds since they were not available in the NIST11 chemical compounds database.

The most abundant compound was benzaldehyde, 3-methoxy, a phenolic followed by 2,2-dimethyl-3-(3,7,16,20-tetramethylheicosane-3,7,11,19-pentyl)-oxirane, a triterpenoid derivative and then 3,7,11,15-tetramethyl-2-hexadecen-1-ol, a diterpenoid as demonstrated by the heights of their chromatograph peaks in the figure 3.4.

Of the nine (9) unknown compounds, 9, 61 and 68 were the most abundant. Their spectra images from deconvolution of their chromatograms are shown in Figure 3.1, 3.2 and 3.3. Compound 9 eluted at 6.3 minutes and had the charge to mass ratio (m/z) of 164.12, and in the entire scan this was designated as compound 12 because many fragments of the chemical compounds were repeated in the scan. Compound 61 eluted at 32.5 minutes and its m/z was 314.16, and its spectrum is shown in figure 3.2. The compound 61 has the highest peak height, an indication that it is the most abundant of all the unknown chemical compounds in *O. americanum*. Compound 68 eluted at 35.5 minutes and its m/z was 444.35 and was the second most abundant unknown compound.

The unidentified compound 68 by NIST2011 database could be cyclohex-2-ene-1, 4-diyl bis (4-nitrophenyl) dicarbonate with molecular mass of 444.35, and occurs in *trans* and *cis* forms and its spectra is shown in figure 3.3 [10]. This compound is classified among the naturally occurring fungicides for many crops and has insecticidal properties [11].

**Figure 3.1.** The spectrum of the unknown compound 9**Figure 3.2.** The spectrum of compound 61, with m/z ratio of 314.16

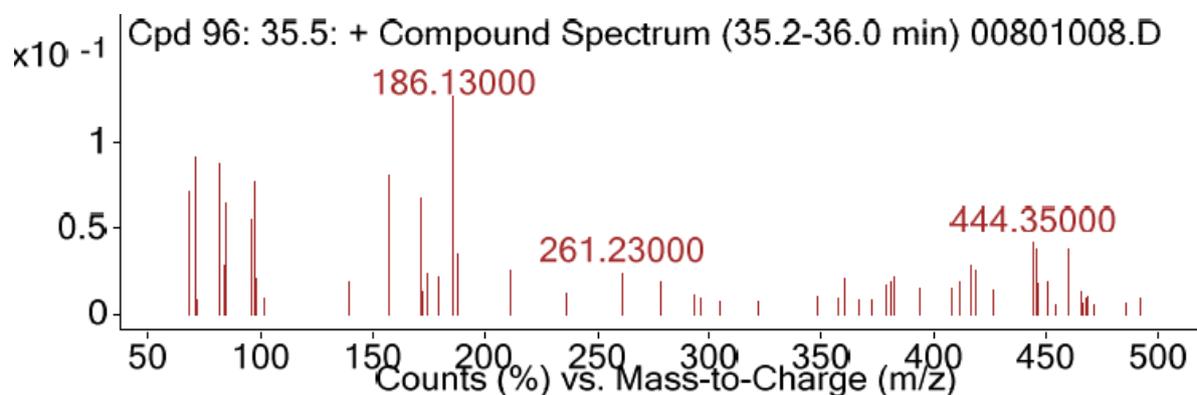

Figure 3.3. The spectrum of compound 68, with m/z ratio of 444.16

69	35.6	1,4-dimethyl-8-isopropylidetricyclo[5.4.0.0(4,10)]decane (ST)	C <sub>15</sub> H <sub>24</sub>

**Legend:** FAD stands for fatty acid derivatives, MT for monoterpene, FA for fatty acid, S for phytosterol and ST for sesquiterpene, PCTT for pentacyclic triterpene, DT for diterpene, TTD for triterpene derivative and DTD for diterpene derivative, A for alkaloids, PP for phenylpropanoids, PA for phenolic alkaloids, A for alkaloids, P for phenolics, TTDvit stands for triterpene derivative of the vitamin and TT for triterpene.

### 3.4. Antioxidant Activity

#### 3.4.1. Free Radical Scavenging Activity by DPPH Assay

The effect of antioxidants on DPPH is thought to be due to their hydrogen donating ability. The antioxidant activity of *O.*

*americanum* was  $50.47 \pm 0.03\%$  compared to  $97.76 \pm 0.03\%$  of ascorbic acid reference. The observed activities indicate that the plant powders have a strong proton-donating ability and could serve as free radical scavengers, acting perhaps as primary antioxidants.

### 3.4.2. Total Antioxidant Activity by Phosphomolybdate Assay

The phosphomolybdate assay is based on the reduction of Mo (VI) to Mo (V) by the plants extracts and the ascorbic acid fractions and subsequent formation of a green phosphate Mo (V) complex at the acid pH. *O. americanum* total antioxidant activity was  $60.08 \pm 0.11$  ascorbic acid equivalent (AAE) in  $\mu\text{g}/\text{mg}$  of dry powder.

### 3.4.3. Reducing Power

As depicted in figure 3.5, a sequential increase in reducing power demonstrated by increase in absorbances with increase in the concentration of gallic acid and plants extract was observed. This is as a result of continued formation of a blue  $\text{Fe}^{2+}$  complex. *O. americanum* demonstrated a rapid and significantly high reducing potential, which reached the maximum level at the concentration of  $400 \mu\text{g}/\text{mL}$  that was slightly lower than that of the gallic acid standard even in low concentrations.

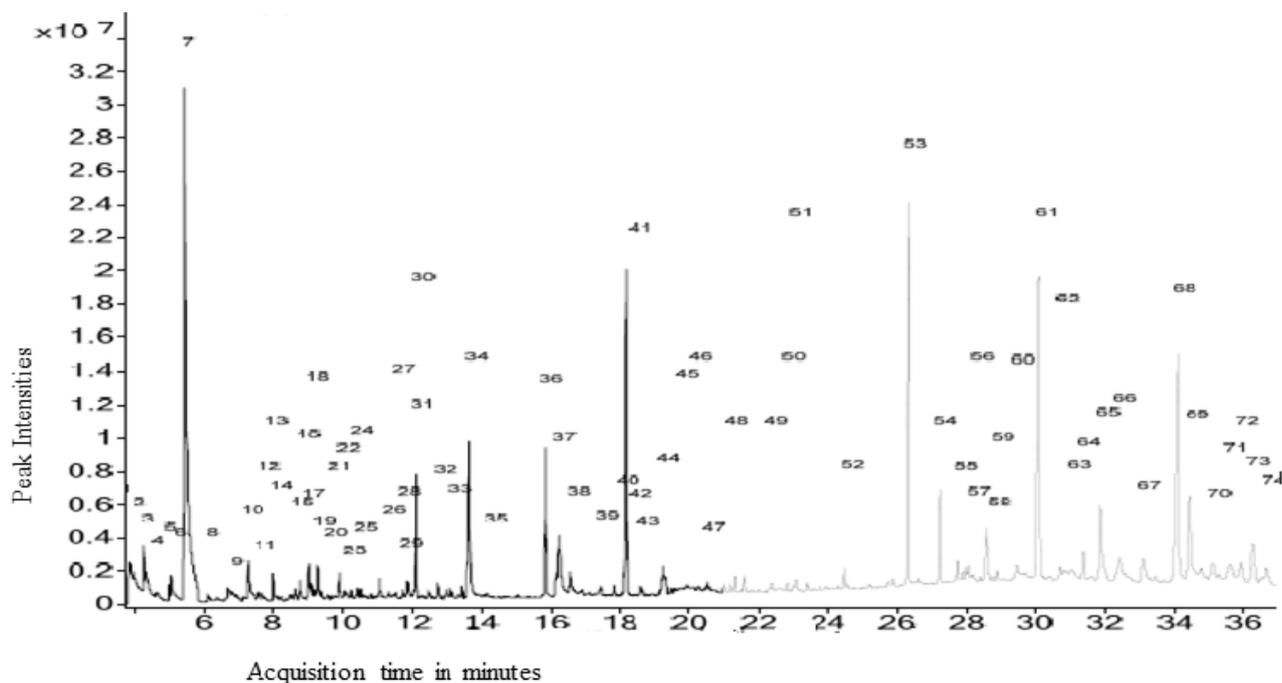

Figure 3.4. GC-MS chromatogram of chemical compounds from ethyl acetate extracts of *O. americanum*

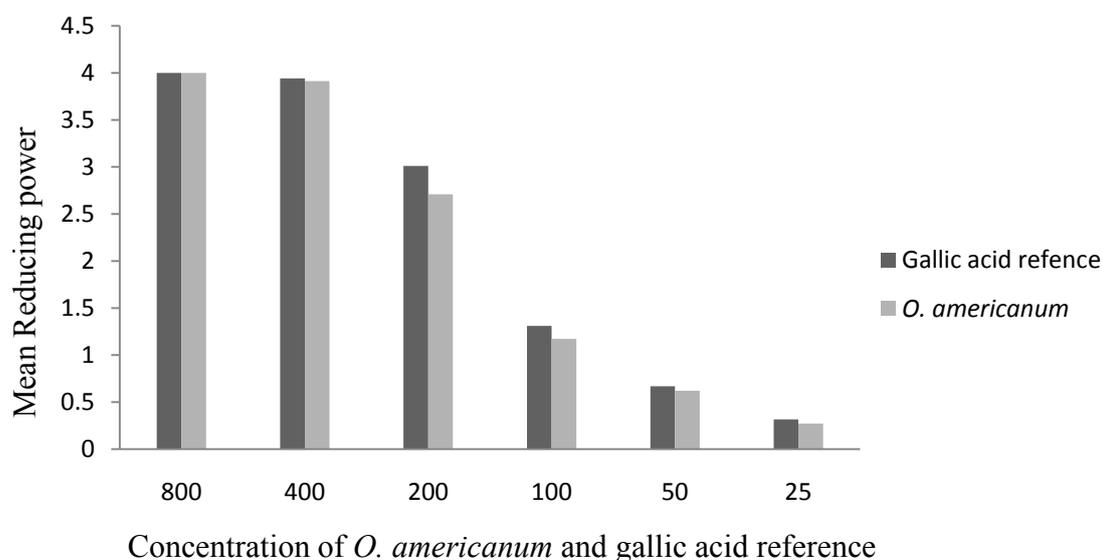

Figure 3.5. Plots of absorbance against concentration of the gallic acid reference and *O. americanum* powder ranging from 25-800 $\mu\text{g}/\text{mL}$

## 4. Discussion and Conclusions

*O. americanum* contained phytochemicals: phenols, tannins, saponins, flavonoids, alkaloids, terpenoids, phylobatannins, cardiac glycosides, sterols, fatty acids and reducing sugars; phytonutrients: vitamins C, E, B1, B3, retinol,  $\beta$ -carotene, lycopene and cryptoxanthin among other diverse and complex chemical compounds. Natural products have complex molecular structures, with cyclic semi-rigid scaffolds, several chiral centers, more than five H-bond donors, more than ten H-bond acceptors, more than five rotatable C-C bonds, a large polar surface area, and a molecular weight above 500 [12]. These properties are critical in their suitability as therapeutic agents because the aid in absorption and transport to the target sites.

Strong antioxidant activities in medicinal plants are due to the presence of phenolic and polyphenolic compounds [13]. Free radicals scavenging effects of tea polyphenolic compounds supports their use in the management of diseases such as coronary heart disease, hypertension, diabetes and cancer [13, 14]. The expression of antioxidant enzymes and other detoxifying enzymes can be regulated by oxidative stress and by low concentrations of a broad variety of chemical agents which includes antioxidants [15].

Antioxidants such as flavonoids, vitamin C, vitamin E, lycopene,  $\beta$ -carotene, and cryptoxanthin present in *O. americanum* are important in neutralizing the reactive oxygen species (hydroxy and superoxide radicals, hydrogen peroxide, lipid peroxides) and help to maintain optimal cellular and systemic health [16]. These antioxidants interact and synergistically stabilize, or deactivate, free radicals before they attack cells. Glutathione and vitamin C work interactively to quench free radicals and have a sparing effect on each other. Vitamin E neutralizes hydrogen peroxide, and lipid peroxides and is the most effective chain-breaking antioxidant within the cell membrane where it protects membrane fatty acids from lipid peroxidation. Vitamin C regenerates vitamin E [16]. Beta carotene and other carotenoids provide antioxidant protection to lipid-rich tissues by working synergistically with vitamin E. A diet that is excessively low in fat may negatively affect beta carotene and vitamin E absorption, as well as other fat-soluble nutrients. Flavonoids neutralize hydroxy and superoxide radicals, hydrogen peroxide and lipid peroxides thereby acting as protectors against a wide range of environmental stress and in humans and animals, they function as biological response modifiers.

In addition to an antioxidant effect, flavonoid compounds may exert protection against heart disease through the inhibition of cyclooxygenase and lipoxygenase activities in platelets and macrophages. Antioxidants are responsible for most of the biological activities of phytochemicals including antidiabetic, anti-inflammatory, anti-allergenic, antiviral, anti-aging and anti-carcinogenic activities [17].

The pentacyclic triterpenoids (PCTT) identified includes; beta-amyrin, lup-20 (29)-en-3-one and fern-7-en-3.beta-ol, while phytosterols includes; stigmasterol, and lanosterol.

The phytosterols are mainly triterpenes which are integral structural components of plants cell membranes, and free sterols involved in stabilizing phospholipid bilayers [18]. Most of the phytosterols contain 28 or 29 carbon atoms and one or two carbon-carbon double bonds, typically one in the sterol nucleus and sometimes a second one is the alkyl side chain [18]. n-hexadecanoic acid is an essential oil demonstrated to possess antifungal, anthelmintic and antimicrobial activities [19]. Stigmasterol has been shown to reduce tumor yields and counteract the proliferative changes associated with carcinogenesis [19]. The unknown chemical compounds irrespective of their amounts could be important therapeutic agents and a source of the biological activities claimed for among traditional healers.

In conclusion, the many diverse chemical compounds identified and some quantified, the *in vitro* antioxidant activity of *O. americanum*, makes it a holistic plant for use in traditional medicine and for aesthetic value among the local communities in Kenya. There is a need to carry out bioassay guided fractionation of the extracts to determine the ones that are biologically active.

## ACKNOWLEDGEMENTS

The authors wish to acknowledge the Kenya Bureau of Standards management for the support including the use of their facilities for analytical work. This study was financially supported by the National Council of Science and Technology (NCST), Kenya, through a grant number NCST/5/003/2<sup>nd</sup> CALL PhD/102.
