# Equivalent Function to the Implicit Function $X^{Y}=Y^{X}$ 

José María Mínguez<br>Dpto. de Física Aplicada II, Universidad de Bilbao, Bilbao, 48930, Spain

#### Abstract

This short paper deals with the implicit function $X^{Y}=Y^{X}, \mathrm{X}, \mathrm{Y}>0$, and shows surprinsingly how accurately it is equivalent to another very much simpler and explicit function.

Keywords Power Exponential Function, Equivalent Function, Approximation

## 1. Introduction

The literature devoted to the equation $X^{Y}=Y^{X}$, $X, Y>0$, is really limited. From[1] we know that L. Euler treated it and gave a parametric representation, from which the rational solutions were drawn. He also deduced the existence of the two asymptotes $(X=1$ and $Y=1)$ to the curve. The same paper gives notice that also Daniel Bernouilli found the rational solutions. Later E. J. Moulton[2] writes a discussion of the curve defined by $X^{Y}=Y^{X}$, $X, Y>0$, and recently Y. S. Kupitz and H. Martini[3] demonstrate the following two propositions: (1) There is a non-trivial solution $X(\neq Y)$ to the equation $X^{Y}=Y^{X}$, $X, Y>0$, if and only if $1<Y \neq e$, and for such a $Y$ the solution is unique, and (2) The only non-trivial integer solutions to the equation $X^{Y}=Y^{X}, \quad X, Y>0$, are $(2,4)$ and (4, 2).

Recently this function has also focussed the attention of mathematicians[5,6], although little has been added to its knowledge and development.
In brief, it is well known that the implicit power- exponential function

$$
\begin{equation*}
X^{Y}=Y^{X}, \quad X, Y>0 \tag{1}
\end{equation*}
$$

admits the trivial solution, which will be named as solution (A),

$$
\begin{equation*}
Y_{A}=X \tag{2}
\end{equation*}
$$

and another solution (B), which may be found either by successive iterations or by using some software, like Mathematica[4], in a computer.

Obviously, solution (B) is symmetrical with respect to the straight line defined by solution (A).

## 2. Non-Trivial Solution (B)

To find out the solution (B) one can proceed as follows:

[^0]From (1)

$$
\begin{gather*}
Y \ln X=X \ln Y  \tag{3}\\
\ln Y=\frac{Y \ln X}{X}  \tag{4}\\
Y=e^{Y \ln X / X}  \tag{5}\\
-\frac{Y \ln X}{X}=-\frac{\ln X}{X} e^{Y \ln X / X}  \tag{6}\\
-\frac{\ln X}{X}=-\frac{Y \ln X}{X} e^{-Y \ln X / X} \tag{7}
\end{gather*}
$$

And,

$$
\begin{equation*}
-\frac{Y \ln X}{X}=\operatorname{Pr} o d u c t \log \left(-\frac{\ln X}{X}\right) \tag{8}
\end{equation*}
$$

being ProductLog[z] the function which gives the principal solution for $w$ in

$$
\begin{equation*}
z=w e^{w} \tag{9}
\end{equation*}
$$

as defined and tabulated by Mathematica.
Then solution (B) may be tabulated from

$$
\begin{equation*}
Y_{B}=-\frac{X}{\ln X} \operatorname{Pr} \text { oductLog }\left(-\frac{\ln X}{X}\right) \tag{10}
\end{equation*}
$$

Both, equation (10) and direct iterations, yield the results shown in Table I, by means of which figure 1 represents the solution (B) (continuous line), together with solution (A) (discontinuous line).

## 3. Equivalent Function

Figure 1 shows at first glance that the function $Y_{B}$ looks very close to the hyperbola

$$
\begin{equation*}
(X-1)(Y-1)=3 \tag{11}
\end{equation*}
$$

which, by the way, also admits the integer solutions $(2,4)$ and $(4,2)$ as equation $(1)$.

In order to analyse how close the function (11) is to the original function $Y_{B}$, a third column $\left(Y_{H I}\right)$ is added in Table I, showing

$$
\begin{equation*}
Y_{H 1}=\frac{3}{X-1}+1 \tag{12}
\end{equation*}
$$

as given by (11), whereas the fifth column shows the distance $Y_{H I}-Y_{B}$.

Then, accounting for the fact that the curve $Y_{B}=Y_{B}(X)$ also goes through the point $(e, e)$, the hyperbola

$$
\begin{equation*}
(X-1)(Y-1)=(e-1)^{2} \tag{13}
\end{equation*}
$$

is considered too and

$$
\begin{equation*}
Y_{H 2}=\frac{(e-1)^{2}}{X-1}+1 \tag{14}
\end{equation*}
$$

as given by (13), is shown in the fourth column of table 1 , whereas the distance $Y_{H 2}-Y_{B}$ appears in the sixth column.

Table 1.

| $X$ | $Y_{B}$ | $Y_{H I}$ | $Y_{H 2}$ | $Y_{H I}-Y_{B}$ | $Y_{H 2}-Y_{B}$ |
| :---: | :---: | :--- | :--- | :--- | :---: |

| 60.0 | 1.0762 | 1.0508 | 1.0500 | -0.0254 | -0.0262 |
| 70.0 | 1.0669 | 1.0435 | 1.0428 | -0.0234 | -0.0241 |
| 80.0 | 1.0598 | 1.0380 | 1.0374 | -0.0218 | -0.0224 |
| 90.0 | 1.0541 | 1.0337 | 1.0332 | -0.0204 | -0.0209 |
| 100.0 | 1.0495 | 1.0303 | 1.0298 | -0.0192 | -0.0197 |
| 125.0 | 1.0410 | 1.0242 | 1.0238 | -0.0168 | -0.0172 |
| 150.0 | 1.0352 | 1.0201 | 1.0198 | -0.0151 | -0.0154 |
| 175.0 | 1.0309 | 1.0172 | 1.0170 | -0.0137 | -0.0139 |
| 200.0 | 1.0276 | 1.0151 | 1.0148 | -0.0125 | -0.0128 |
| 250.0 | 1.0228 | 1.0120 | 1.0119 | -0.0108 | -0.0109 |
| 300.0 | 1.0196 | 1.0100 | 1.0099 | -0.0096 | -0.0097 |
| 400.0 | 1.0153 | 1.0075 | 1.0074 | -0.0078 | -0.0079 |
| 500.0 | 1.0127 | 1.0060 | 1.0059 | -0.0067 | -0.0068 |
|  |  |  |  |  |  |
| 10 |  |  |  |  |  |

Thus, direct reading of table I shows that the hyperbola (11) is closer to $Y_{B}$ than the hyperbola (13), and that

$$
\begin{equation*}
\left|Y_{H 1}-Y_{B}\right|<0.04 \tag{15}
\end{equation*}
$$

for two reasons: 1) this value is not reached before $X=150$, and 2) for $X=150$ and onwards the distance between $Y_{B}$ and the asymptote $Y=1$, as well as between $Y_{H I}$ and the
same asymptote, is less than 0.04 , which implies (15).
In fact, in figure 1 the points representing $Y_{H I}$ are plotted over the curve $Y_{B}$ and the closeness is very evident.

Figure 1. Trivial solution (A) (discontinuous straight line) and solution (B) (full line curve). Overlapping the curve the dots representing the equivalent hyperbolic function

## 4. Conclusions

The little difference between the two functions $Y_{H I}$ and $Y_{B}$, which remains always under 0.04 , means that the much simpler hyperbola given by equation (11) is a very good approximation to the implicit power-exponential function defined by equation (1).
